TOURIST ESTABLISHMENT OCCUPANCY REPORT

---

Sampling Method

In order to calculate the occupancy of all types of tourist establishments in Ontario, by Vacation Area, during the months of July and August, ten per cent of each type of establishment licensed by the Ontario Department of Tourism and Information and the Liquor License Board of Ontario, i.e., hotel, lodge, motel, cottage, campsite, cabin (or other), were selected randomly in each of the 32 Ontario vacation areas.

One sampling card (see Appendix) was forwarded during the month of July, and another during the month of August to each selected establishment. Basic description of the establishment contacted was given on each card, and in addition, provision was made for three basic data on which the sample was based:

- (a) total number of rental units available
- (b) number of rental units occupied
- (c) selected weeks (in rotation)

Weeks for each month were selected randomly and transcribed on each card by Travel Research Branch. These survey cards were transmitted to the tourist establishments selected through the field staff of the Tourist Industry Development Branch, Ontario Department of Tourism and Information. Upon completion by the tourist establishments, they were mailed directly to Travel Research Branch, where the first screening was made, deleting those which were improperly filled out and calculations made.

If additional information on the method of calculation for each month, in each type of establishment, in all vacation areas, is desired, please contact Travel Research Branch at 185 Bloor Street East, Toronto 5.

The following tables include all occupancy indices, expressed in per cent, for groups of vacation areas, and each type of establishment, and also totals for the province.

Quite a wide range of rental units and establishments was tabulated. However, not all establishments supplied the required information; in some case data supplied was incomplete, and in another few instances, data was received too late to be included in the tabulation so that less than 10 per cent of all establishments were actually processed. In some instances, the number of establishments replying correctly was so low that the validity of the occupancy index is questionable.

This sampling will be carried out yearly during the months of January and July and we hope that with improved co-operation of establishment owners, validity of the occupancy index will improve.

The ten per cent random selection of tourist establishments will be changed, every twelve months.

The basic sampling method used was probability proportional to size. We hope that the occupancy index will prove useful to all those connected with the tourist industry.
